Security Issues (SAST)

Total Security Issues: 26
High: 1 | Medium: 8 | Low: 17

Possibility of prototype polluting function detected. By adding or modifying attributes of an object prototype, it is possible to create attributes that exist on every object, or replace critical attributes with malicious ones. This can be problematic if the software depends on existence or non-existence of certain attributes, or uses pre-defined attributes of object prototype (such as `hasOwnProperty`, `toString` or `valueOf`). Possible mitigations might be: freezing the object prototype, using an object without prototypes (via `Object.create(null)`), blocking modifications of attributes that resolve to object prototype, using `Map` instead of object.

File Path	Line	Severity	CWE	OWASP
frontend/src/hooks/useTranslation.tsx	136	LOW	CWE-915: Improperly Controlled Modification of Dynamically-Determined Object Attributes	A08:2021 - Software and Data Integrity Failures, A08:2025 - Software or Data Integrity Failures

The application was observed to store keychain items that do not leverage user authentication. Requiring the user to provide authentication increases the confidence that the person using the phone is indeed authorized to view the information being retrieved.

File Path	Line	Severity	CWE	OWASP
mobile/ios/ApplyAsAService/Services/NetworkService.swift	644	MEDIUM	CWE-287: Improper Authentication	A02:2017 - Broken Authentication, A07:2021 - Identification and Authentication Failures

The application was observed to store keychain items that do not leverage user authentication. Requiring the user to provide authentication increases the confidence that the person using the phone is indeed authorized to view the information being retrieved.

File Path	Line	Severity	CWE	OWASP
mobile/ios/ApplyAsAService/Services/BiometricAuthManager.swift	250	MEDIUM	CWE-287: Improper Authentication	A02:2017 - Broken Authentication, A07:2021 - Identification and Authentication Failures

Key generation routines were identified where the resultant keys are not stored protected by the Secure Enclave. On iOS/macOS systems, cryptographic keys can be generated within the Secure Enclave - making them inaccessible to the rest of the system. The keys can be used for operations (signing, decryption, etc) but the private keys cannot be dumped or copied - even on rooted/jailbroken systems.

File Path	Line	Severity	CWE	OWASP
mobile/ios/ApplyAsAService/Services/BiometricAuthManager.swift	228	LOW	CWE-922: Insecure Storage of Sensitive Information	A01:2021 - Broken Access Control

The application was observed to leverage biometrics via Local Authentication, which returns a simple boolean result for authentication. This design is subject to bypass with runtime tampering tools such as Frida, Substrate, and others. Although this is limited to rooted (jailbroken) devices, consider implementing biometric authentication the reliable way - via Keychain Services.

RegExp() called with a `selector` function argument, this might allow an attacker to cause a Regular Expression Denial-of-Service (ReDoS) within your application as RegExP blocks the main thread. For this reason, it is recommended to use hardcoded regexes instead. If your regex is run on user-controlled input, consider performing input validation or use a regex checking/sanitization library such as <https://www.npmjs.com/package/recheck> to verify that the regex does not appear vulnerable to ReDoS.

`excludePath.replace` method will only replace the first occurrence when used with a string argument (*). If this method is used for escaping of dangerous data then there is a possibility for a bypass. Try to use sanitization library instead or use a Regex with a global flag.
